# What is an Array

- An array is a collection of items of same data type stored at contiguous memory locations.

0	1	2	3
0	0	0	0

# Declaring an Array

- An array of a type is declared by appending open and close square bracket, [ ], after the type.

```
int[] intArray;  
double[] doubleArray;  
String[] bunchofStrings;
```

0	1	2	3
0	0	0	0

# Allocating Memory for an Array

- Declaring an array only creates the object, it does not allocate memory to store the array.

```
int[] intArray;
```

# Allocating Memory for an Array

- To allocate memory, we use the keyword `new`.

```
int[] intArray;  
intArray = new int[4];
```

- `new` will allocate the array and initialize all values to zero.

# Allocating Memory for an Array

- We can also initialize an array with comma-separated sequence of elements enclosed in curly braces:

```
int[] intArray = { 3, 7, 2, 5 };
```

# Accessing Arrays

- We use the *index* to access the array:

```
int[] intArray = { 3, 7, 2, 5 };  
intArray[2] = 4;
```

# Accessing Arrays

- We use the *index* to access the array:

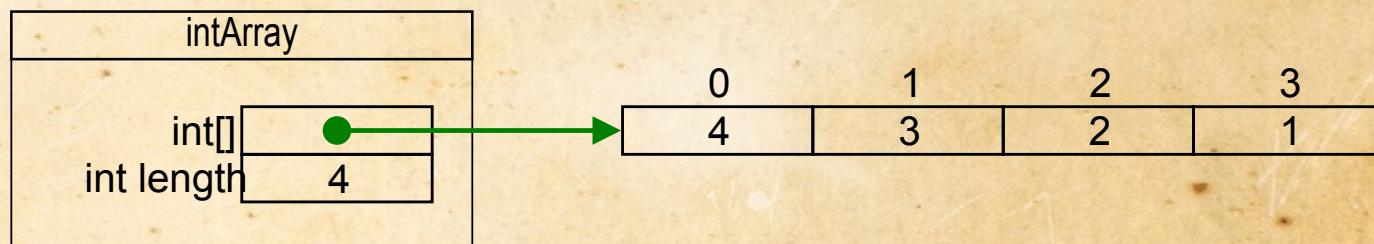

```
int[] intArray = { 3, 7, 2, 5 };
for(int i = 1; i < 4; i++) {
    intArray[i] = 9;
}
```

# Finding the Length of an Array

- We use the `.length` field when we need to find the length of the array:

```
int[] intArray = { 3, 7, 2, 5 };
for(int i = 0; i < intArray.length; i++) {
    intArray[i] = 4 - i;
}
```

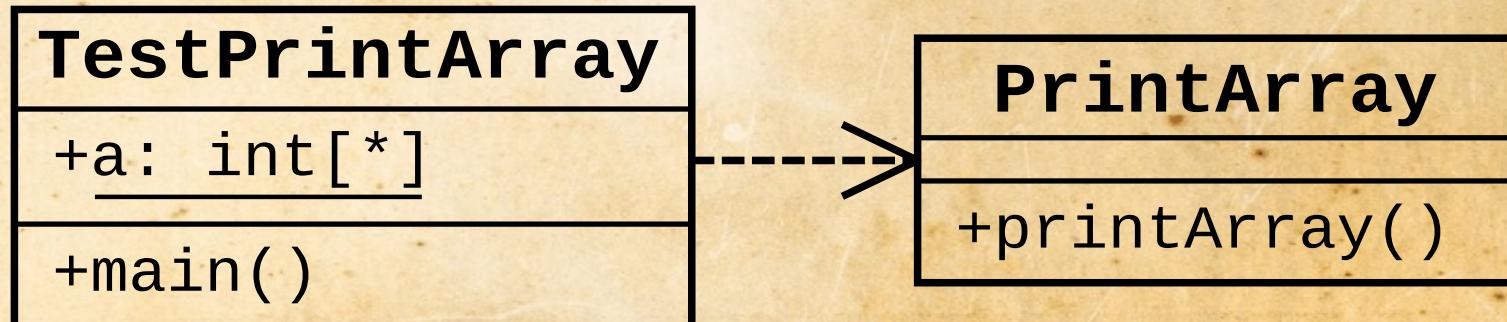

# Printing Arrays

# Printing Arrays

- Create a class called `PrintArray` that contains a method, `printArray()`, that takes an array of integers (`int []`) as a parameter, and prints that array in mathematical set notation.
- Then make a class with (at minimum) a `main` method that will test your `PrintArray` class.
- The UML diagram here may help:

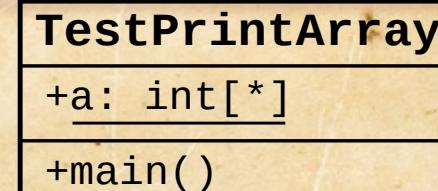

# Printing Arrays

```
1 package com.bjfles.apcsca.unit6;
2
3 public class TestPrintArray {
4
5     static int a[] = { 5, 7, 6 };
6
7     public static void main(String[] args) {
8         PrintArray.printArray(a);
9     }
10 }
```

```
Problems Javadoc Declaration Console Terminal

{ 5, 7, 6 }
```

It is suggested that your main method will have more test cases than the one above.

```
1 package com.bjfles.apcsca.unit6;
2
3 public class PrintArray {
4     /**
5      * Print the numerical array to the console in
6      * set notation
7      *
8      * For example, the array defined as:
9      *     int[] a = { 5, 7, 6 };
10     * Will display as:
11     *     { 5, 7, 6 }
12     *
13     * @param a the array of numbers
14     */
15     public static void printArray(int[] a) {
16
17     }
18 }
```
