Internet Protocol version 4 (IPv4) Header

Lecture Contents

- IPv4 header
 - Version
 - Internet Header Length (IHL)
 - Type of Service
 - Total Length
 - Identification
 - Flags
 - Fragment Offset
 - Time to Live (TTL)
 - Protocol
 - Header Checksum
 - Source Address
 - Destination Address

-

[illegible]

Internet Protocol version 4 (IPv4)

- Header given in *IEN 54* (and *RFC 760*)

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding

Internet Protocol version 4 (IPv4)

- **Version** (4 bits)
 - Set to 4: **0100**
- **IHL**: *Internet Header Length* (4 bits)
 - Length in 32-bit words
 - Minimum 5, maximum 15 (60 bytes)
 - Points to beginning of data
- **ToS**: Type of Service (8 bits)
 - Parameters of the *quality of service* desired
 - e.g.: speed versus reliability

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding

Internet Protocol version 4 (IPv4)

- **Total Length** (16 bits)

- Length in bytes of datagram
- Includes header, data
- 16 bits = 65,535 bytes (impractical)
- Host must accept 576-byte
 - 64-byte header, 512-byte data

- **Identification** (4 bits)

- Assigned by sender to aid in assembling the fragments of a datagram

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding

Internet Protocol version 4 (IPv4)

- **Flags** (3 bits)

- [0] – reserved; must be zero
- [1] – don't fragment
 - Host can't reassemble
 - Maximum transmission Unit (MTU) discovery
- [2] – more fragments
 - All fragmented packets except the last

- **Fragment Offset** (13 bits)

- Units of 8 bytes (fragment length must be a multiple of 8 bytes)
 - $(2^{13} = 8192) \times (2^3 = 8 \text{ bytes}) = 65536$

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding

Internet Protocol version 4 (IPv4)

- **Time to Live (8 bits)**

- Prevent network loop from causing network failure
- Time in seconds
- In practice, hop count
- When exceeded, *Internet Control Message Protocol (ICMP) message time exceeded* sent to sender
- Program *traceroute* sends messages with adjusted TTL values and uses *ICMP time exceeded messages* to identify the routers traversed by packets

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding

Internet Protocol version 4 (IPv4)

- **Protocol (8 bits)**
 - 0x01: ICMP
 - 0x06: TCP
 - 0x11: UDP
 - 0x21: DCCP – data congestion control protocol
 - 0x29: IPv6 – IPv6 encapsulation

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding

Internet Protocol version 4 (IPv4)

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding

- **Header Checksum (16 bits)**

- TCP/UDP have checksums for data
- Recomputed when TTL changes
- 16-bit one's complement of the one's complement sum of all 16-bit words in the header. For purposes of computing the checksum, the checksum field is zero.
- Receiving, the sum of the entire IP header should be zero.

Internet Protocol version 4 (IPv4)

- **Source Address** (32 bits)
 - 192.168.100.1
- **Destination Address** (32 bits)

Version	IHL	ToS	Total Length	
Identification			Flags	Fragment Offset
Time To Live	Protocol		Header Checksum	
Source Address				
Destination Address				
Options				Padding
